People who need to ensure their computers run normally have no choice but to scan for malware and spyware, and then get rid of the identified threats. The most common approach is to run a standard virus scanner, and then open all the resulting files in order to verify that they are clean. Although this method is effective, it is not optimal for several reasons. In the first place, malware and spyware detection is usually based on analyzing the digital footprints left behind by the malware, so it is only as thorough as the software it is employing, and this is by no means a guarantee that the identified malware is going to be really a threat. Even if the software is reliable, there is a fundamental problem - it needs to constantly scan your computer for any new threats that may try to exploit it. This is very time consuming, and you do not want to spend hours waiting for a clean computer when you do not need to. The solution? Start using Threat Intelligence to fight against malware. Threat Intelligence is a method of searching out for and analyzing the malware that is out there, rather than relying on a constant scan. This means that you can make use of a database of malware and spyware, which is constantly updated, to check your computer for any new threats. Once you have installed and configured it on your computer, it will automatically check for any newly identified threats by making periodic scans, and

Ownership and presentation of proprietary B-cell lines by the U.S. Army Medical Research Institute of Infectious Diseases. In recent years, the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) has established a B-cell line repository and made B-cell lines available to the U.S. scientific and medical communities. While many of the clinical isolates were collected from military personnel at USAMRIID, a very small number of the B-cell lines were obtained from laboratory workers of other institutions. To the best of our knowledge, the data contained herein represent the only large collection of B-cell lines available in the U.S. These B-cell lines were used for a wide variety of purposes, including production of monoclonal antibodies, as antigen-presenting cells, as HIV transfectants, and in studies of intracellular signaling, neutralization, and complement deposition. All of the USAMRIID B-cell lines are part of an open-access B-cell line repository and are made available to the scientific community without restriction.
